

36+18+40=94

PROBLEM 1:-

$$\begin{aligned} \text{Given L.P} \quad \text{Max } C \cdot x \\ \text{s.t. } Ax \leq b \\ x \geq 0. \end{aligned}$$

1) given $b=0$

(a) To prove:- The above L.P is feasible & deduce a lower bound.

Proof:- W.K.T $Ax \leq 0$, so $x=0$ is a sol. for the given problem

\Rightarrow The problem is feasible.

Sub. $x=0$ in the problem, we get $z=0$ which is the lower bound for the problem.

(b) To prove:- The above one is degenerate.

proof:- Adding slack variables, we get.

$$\begin{aligned} x_s &= b - Ax \\ z &= Cx \end{aligned}$$

$$\begin{aligned} \text{W.K.T } b=0, \quad x_s &= -Ax \\ z &= Cx \end{aligned}$$

Sub non basic Variables equal to zero, we get $x_s=0$.

Since one (or) more basic Variables have the value zero, the dictionary is degenerate.

(c) There are two possible Sol. for $Ax=0$

Trivial Sol :- when $x=0$, this case feasible set is reduced to a single point of R^n .

Non-Trivial Sol :- $x \neq 0$, & A is a singular matrix, this case the feasible set is unbounded as x can take any value.

(d) To prove :- The LP is unbounded or, its optimal value is zero.

As we know $\max Cx \quad b=0.$
s.t. $Ax \leq b$
 $x \geq 0$

$\Rightarrow Ax \leq 0$, so when $x=0$, it satisfies $x \geq 0$. all the conditions and on substituting it in the objective function, we get optimal value = 0.

\Rightarrow when $x \neq 0$, x can take any values to satisfy the condition $Ax \leq 0$ which implies x can be taken any value without affecting the problem, \Rightarrow The problem is unbounded.

-2
key point is the discussion about vector c.

(c) To prove the above using duality theory.

W.K.T dual of the above L.P is

$$\begin{array}{ll}\text{Min} & b^T y \\ \text{s.t} & A^T y \geq c \\ & y \geq 0\end{array}$$

-2

$\because b=0$; we need to minimize $0 \cdot y$
So whatever is the value of y the optimal value is zero.

Another unbounded case ?

2) Given $A = \begin{pmatrix} 0.5 & -5.5 & -2.5 & 9 \\ 0.5 & -1.5 & -0.5 & 1 \\ 1 & 0 & 0 & 0 \end{pmatrix}$ $b = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$ & $C = \begin{pmatrix} 10 \\ -57 \\ -9 \\ -24 \end{pmatrix}$

(a) Initial Dictionary :-

$$x_5 = -0.5x_1 + 5.5x_2 + 2.5x_3 - 9x_4$$

$$x_6 = -0.5x_1 + 1.5x_2 + 0.5x_3 - x_4$$

$$x_3 = 1 - x_1$$

$$z = 10x_1 - 57x_2 - 9x_3 - 24x_4$$

Substituting the non-basic variables, $x_1, x_2, x_3, x_4 = 0$
we get $x_5 = 0$; $x_6 = 0$; $x_3 = 1$ & $z = 0$.

$\therefore (0, 0, 0, 0)$ is a solution for the given problem,
 \Rightarrow The problem is 'feasible'.

Since the value of more than one basic variables (x_5, x_6) is equal to zero, the given dictionary is 'degenerate'.

(b) Solving the above problem using the following rule

- (i) largest coefficient rule for entering variable
- (ii) smallest index subscript for leaving variable

To prove :- The Simplex method cycles after 6 iterations

Proof:- $D_1 \Rightarrow x_5 = -0.5x_1 + 5.5x_2 + 2.5x_3 - 9x_4$

$$x_6 = -0.5x_1 + 1.5x_2 + 0.5x_3 - x_4$$

$$x_3 = 1 - x_1$$

$$z = 10x_1 - 57x_2 - 9x_3 - 24x_4$$

' x_1 ' is entering & ' x_5 ' is leaving Variable.

$$\begin{aligned} D_2 \Rightarrow \quad x_1 &= 11x_2 + 5x_3 - 18x_4 - 2x_5 \\ x_6 &= -4x_2 - 2x_3 + 8x_4 + x_5 \\ x_7 &= 1 - 11x_2 - 5x_3 + 18x_4 + 2x_5 \\ \hline z &= 53x_2 + 41x_3 - 204x_4 - 20x_5 \end{aligned}$$

' x_2 ' is entering & ' x_6 ' is leaving Variable.

$$\begin{aligned} D_3 \Rightarrow \quad x_2 &= -0.5x_3 + 2x_4 + 0.25x_5 - 0.25x_6 \\ x_1 &= -0.5x_3 + 4x_4 + 0.75x_5 - 2.75x_6 \\ x_7 &= 1 + 0.5x_3 - 4x_4 - 0.75x_5 + 2.75x_6 \\ \hline z &= 14.5x_3 - 98x_4 - 6.75x_5 - 13.25x_6 \end{aligned}$$

' x_3 ' is entering & ' x_1 ' is leaving Variable.

$$\begin{aligned} D_4 \Rightarrow \quad x_3 &= -2x_1 + 8x_4 + 1.5x_5 - 5.5x_6 \\ x_2 &= x_1 - 2x_4 - 0.5x_5 + 2.5x_6 \\ x_7 &= 1 - x_1 \\ \hline z &= -29x_1 + 18x_4 + 15x_5 - 93x_6 \end{aligned}$$

' x_4 ' is entering & ' x_2 ' is leaving Variable.

$$\begin{aligned} D_5 \Rightarrow \quad x_4 &= 0.5x_1 - 0.5x_2 - 0.25x_5 + 1.25x_6 \\ x_3 &= 2x_1 - 4x_2 - 0.5x_5 + 4.5x_6 \\ x_7 &= 1 - 2x_1 \\ \hline z &= -20x_1 - 9x_2 + 10.5x_5 - 70.5x_6 \end{aligned}$$

' x_5 ' is entering & ' x_3 ' is leaving Variable.

$$\begin{aligned}
 D_6 \Rightarrow x_5 &= 4x_1 - 8x_2 - 2x_3 + 9x_6 \\
 x_4 &= -0.5x_1 + 1.5x_2 + 0.5x_3 - x_6 \\
 x_7 &= 1 - x_1 \\
 \hline
 z &= 22x_1 - 93x_2 - 21x_3 + 2 + x_6
 \end{aligned}$$

' x_6 ' is entering & ' x_4 ' is leaving.

$$\begin{aligned}
 D_7 \Rightarrow x_6 &= -0.5x_1 + 1.5x_2 + 0.5x_3 - x_4 \\
 x_7 &= 1 - x_1 \\
 x_5 &= -0.5x_1 + 5.5x_2 + 2.5x_3 - 9x_4 \\
 \hline
 z &= 10x_1 - 57x_2 - 9x_3 - 2 + 2x_4
 \end{aligned}$$

$\Rightarrow D_1 = D_7$, so the simplex cycles after 6 iterations.

(c) using Bland's Rule to solve the given problem.
 untill D_6 , it is the same as the above solution.
 After D_6 , we choose ' x_1 ' is entering & ' x_4 ' is leaving
 Variable

$$\begin{aligned}
 D_7 \Rightarrow x_1 &= 3x_2 + x_3 - 2x_4 - 2x_6 \\
 x_7 &= 1 - 3x_2 - x_3 + 2x_4 + 2x_6 \\
 x_5 &= 4x_2 + 2x_3 - 8x_4 + x_6 \\
 \hline
 z &= -27x_2 + 2x_3 - 44x_4 - 20x_6
 \end{aligned}$$

' x_3 ' is entering & ' x_7 ' is leaving.

$$\begin{aligned}
 D_8 \Rightarrow x_3 &= 1 - 3x_2 + 2x_4 + 2x_6 - x_7 \\
 x_1 &= 1 - x_7 \\
 x_5 &= 2 - 2x_2 - 4x_4 + 5x_6 - 2x_7 \\
 \hline
 z &= 1 - 30x_2 - 42x_4 - 18x_6 - 2x_7
 \end{aligned}
 \left. \vphantom{\begin{aligned} D_8 \Rightarrow x_3 &= 1 - 3x_2 + 2x_4 + 2x_6 - x_7 \\ x_1 &= 1 - x_7 \\ x_5 &= 2 - 2x_2 - 4x_4 + 5x_6 - 2x_7 \\ z &= 1 - 30x_2 - 42x_4 - 18x_6 - 2x_7 \end{aligned}} \right\} \begin{array}{l} \text{FINAL} \\ \text{DICTIONARY} \end{array}$$

Sub, $x_2 = x_4 = x_6 = x_7 = 0$, we get $x_3 = 1$; $x_1 = 1$; $x_5 = 2$
 $\Rightarrow (x_1, x_2, x_3, x_4) = (1, 0, 1, 0)$ is a sol. with $\boxed{Z=1}$

PROBLEM 2:-

$$\begin{aligned}\text{Given L.P : } & \max 2x_1 + 3x_2 - 5x_3 \\ \text{s.t } & x_1 - x_2 \leq 3 \\ & -x_1 + x_3 \leq 6 \\ & -2x_1 + x_3 \leq 2 \\ & -x_1 + x_2 \leq -4 \\ & x_1, x_2, x_3 \geq 0\end{aligned}$$

- 1) To check the feasibility of the dual problem without computing it.

Initial dictionary of the above L.P

$$\begin{aligned}D \Rightarrow & x_4 = 3 - x_1 + x_2 \\ & x_5 = 6 + x_1 - x_3 \\ & x_6 = 2 + 2x_1 - x_3 \\ & x_7 = -4 + x_1 - x_2 \\ \hline & z = 2x_1 + 3x_2 - 5x_3\end{aligned}$$

Since the initial dictionary is infeasible, we need to solve the auxiliary problem first to try to make the Dictionary feasible.

$$\begin{aligned}D' \Rightarrow & x_4 = 3 - x_1 + x_2 + x_0 \\ & x_5 = 6 + x_1 - x_3 + x_0 \\ & x_6 = 2 + 2x_1 - x_3 + x_0 \\ & x_7 = -4 + x_1 - x_2 + x_0 \\ \hline & z = -x_0\end{aligned}$$

Now, we force x_0 to enter, & x_7 leaves as it has the least Coefficient Value.

$$\begin{aligned}
 D'_1 \Rightarrow \quad & x_0 = 4 - x_1 + x_2 - 2x_7 \\
 & x_4 = 7 - 2x_1 + 2x_2 - x_7 \\
 & x_5 = 10 \quad \quad \quad + 2x_2 - 2x_3 - x_7 \\
 & x_6 = 6 + 2x_1 + x_2 - x_3 - 2x_7 \\
 \hline
 & z = -4 + x_1 - x_2 + 2x_7
 \end{aligned}$$

' x_1 ' is the entering & ' x_4 ' is the leaving Variable.

$$\begin{aligned}
 D'_2 \Rightarrow \quad & x_1 = 3.5 + x_2 - 0.5x_4 - 0.5x_7 \\
 & x_0 = 0.5 \quad \quad \quad + 0.5x_4 - 0.5x_7 \\
 & x_5 = 10 + 2x_2 - 2x_3 - 2x_7 \\
 & x_6 = 9.5 + 2x_2 - 2x_3 - 0.5x_4 - 1.5x_7 \\
 \hline
 & z = -0.5 - 0.5x_4 + 0.5x_7
 \end{aligned}$$

' x_7 ' is the entering & ' x_0 ' is the leaving Variable.

$$\begin{aligned}
 D'_3 \Rightarrow \quad & x_7 = 1 + x_4 - 2x_0 \\
 & x_1 = 3 + 2x_2 - 2x_4 + x_0 \\
 & x_5 = 9 + x_2 - 2x_3 - 2x_4 + 2x_0 \\
 & x_6 = 8 + 2x_2 - x_3 - 2x_4 + 3x_0 \\
 \hline
 & z = -2x_0
 \end{aligned}$$

Since we have forced x_0 to leave, we can sub. back our original problem.

$$\begin{aligned}
 D_1 \Rightarrow \quad & x_7 = 1 + x_4 \\
 & x_1 = 3 + 2x_2 - x_4 \\
 & x_5 = 9 + 2x_2 - 2x_3 - 2x_4 \\
 & x_6 = 8 + 2x_2 - x_3 - 2x_4 \\
 \hline
 & z = 6 + 5x_2 - 5x_3 - 2x_4
 \end{aligned}$$

Since, ' x_2 ' is the entering Variable & there is no leaving Variable, the given LP is unbounded.

Some mistake in your computation. The primal should be infeasible. Just check the first and last constraint.

-2

As the primal is unbounded we can now deduce that the Dual is infeasible.

2) Dual of the above L.P is

$$\begin{aligned} \text{Min } & 3y_1 + 6y_2 + 2y_3 - 4y_4 \\ \text{s.t. } & y_1 - y_2 - 2y_3 - y_4 \geq 2 \\ & -y_1 \quad \quad \quad + y_4 \geq 3 \\ & \quad y_2 + y_3 \geq -5 \\ & y_1, y_2, y_3, y_4 \geq 0. \end{aligned}$$

Converting it to std. form.

$$\begin{aligned} \text{Max } & -3y_1 + 6y_2 - 2y_3 + 4y_4 \\ \text{s.t. } & -y_1 + y_2 + 2y_3 + y_4 \leq -2 \\ & y_1 \quad \quad \quad -y_4 \leq -3 \\ & \quad -y_2 - y_3 \leq 5 \\ & y_1, y_2, y_3, y_4 \geq 0. \end{aligned}$$

Initial dictionary is

$$\begin{aligned} D \Rightarrow & y_5 = -2 + y_1 - y_2 - 2y_3 - y_4 \\ & y_6 = -3 - y_1 \quad \quad \quad + y_4 \\ & y_7 = 5 \quad \quad \quad + y_2 + y_3 \\ \underline{z =} & -3y_1 - 6y_2 - 2y_3 + 4y_4 \end{aligned}$$

Since the Initial dictionary is infeasible, we need to solve the auxiliary problem.

$$\begin{aligned} D' \Rightarrow & y_5 = -2 + y_1 - y_2 - 2y_3 - y_4 + y_0 \\ & y_6 = -3 - y_1 \quad \quad \quad + y_4 + y_0 \\ & y_7 = 5 \quad \quad \quad + y_2 + y_3 \quad \quad \quad + y_0 \\ \underline{z =} & -y_0 \end{aligned}$$

Now forcing y_6 to enter, we get.

$$\begin{aligned} D_1' \Rightarrow y_6 &= 3 + y_1 - y_4 + y_6 \\ y_5 &= 1 + 2y_1 - y_2 - 2y_3 - 2y_4 + y_6 \\ y_7 &= 8 + y_1 + y_2 + y_3 - y_4 + y_6 \\ \hline z &= -3 - y_1 + y_4 - y_6 \end{aligned}$$

' y_4 ' is the entering & ' y_5 ' is the leaving Variable.

$$\begin{aligned} D_2' \Rightarrow y_4 &= 0.5 + y_1 - 0.5y_2 - y_3 - 0.5y_5 + 0.5y_6 \\ y_6 &= 2.5 + 0.5y_1 + y_3 + 0.5y_5 + 0.5y_6 \\ y_7 &= 7.5 + 1.5y_2 + 2y_3 + 0.5y_5 + 0.5y_6 \\ \hline z &= -2.5 - 0.5y_2 - y_3 - 0.5y_5 - 0.5y_6 \end{aligned}$$

Since the above dictionary is final & sub the non basic variables $(y_2, y_3, y_5, y_6) = 0$, we get $z = -2.5$, since the value of the auxiliary prob is $-ve$, the given L.P is infeasible.

- 3) To prove:- If a problem is unbounded, then its dual is infeasible.

Let ' x ' be a feasible sol. for P (Primal) & ' y ' be a feasible sol. for D (Dual).

Then by Weak Duality theorem.

$$c^T x \leq b^T y$$

Since we are given primal is unbounded, i.e. $c^T x = +\infty$, we can see that D (Dual) is infeasible.

4) No, the Inverse is not true, if ~~Primal is infeasible~~^{Primal is infeasible}
 then ~~Dual can be~~^{Dual can be} infeasible (or) unbounded.

eg: given L.P max $2x_1 - x_2$
 s.t $x_1 - x_2 \leq 1$
 $-x_1 + x_2 \leq -2$
 $x_1, x_2 \geq 0$.

From the constraints, we can conclude that the given L.P is infeasible as the constraints $x_1 - x_2 \leq 1$ & $x_1 - x_2 \geq 2$ can't be satisfied.

Dual of the L.P min $y_1 - 2y_2$
 s.t $y_1 - y_2 \geq 2$
 $-y_1 + y_2 \geq -1$
 $y_1, y_2 \geq 0$.

Converting to Standard form, we get.

Max $-y_1 + 2y_2$
 s.t $-y_1 + y_2 \leq -2$
 $y_1 - y_2 \leq 1$
 $y_1, y_2 \geq 0$

From the constraints, we can conclude that the dual is infeasible as the constraints $y_1 - y_2 \leq 1$ & $y_1 - y_2 \geq 2$ can't be satisfied.

⇒ If the ~~primal~~^{primal} is infeasible, the ~~dual~~^{dual} can be infeasible and not necessarily unbounded.

PROBLEM 3:-

Given LP, Max $-x_1 - 2x_2$
s.t $-2x_1 + 7x_2 \leq 6$
 $-3x_1 + x_2 \leq -1$
 $9x_1 - 4x_2 \leq 6$
 $x_1 - 2x_2 \leq 3$
 $7x_1 - 3x_2 \leq 6$
 $-5x_1 + 2x_2 \leq -3$
 $x_1 \geq 0, x_2 \geq 0$

1) (a) Dual form of above L.P

Min $6y_1 - y_2 + 6y_3 + 3y_4 + 6y_5 - 3y_6$
s.t $-2y_1 - 3y_2 + 9y_3 + y_4 + 7y_5 - 5y_6 \geq -1$
 $7y_1 + y_2 - 4y_3 - y_4 - 3y_5 + 2y_6 \geq -2$
 $y_1 \geq 0, y_2 \geq 0, y_3 \geq 0, y_4 \geq 0, y_5 \geq 0, y_6 \geq 0$

(b) It is easier to solve the Dual as all the primal objective coefficients are all negative, which helps us avoid the Initialisation phase.

→ optimal Sol. & optimal Value of the given L.P -
Since we need to max $-x_1 - 2x_2$ & we know that $x_1, x_2 \geq 0$.

Let's start by assuming $x_1 = x_2 = 0$

on sub, the constraints $-3x_1 + x_2 \leq -1$ &
 $-5x_1 + 2x_2 \leq -3$
isn't satisfied.

From the two constraints we can see that only the value of x_1 could be increased. So on keeping $x_2=0$, we get:

$$\begin{array}{ll} -3x_1 \leq -1 & \& -5x_1 \leq -3 \\ x_1 \geq 1/3 & \& x_1 \geq 3/5 \end{array}$$

$$\Rightarrow x_1 = 3/5$$

\therefore the optimal sol. is $(x_1, x_2) = (3/5, 0)$
& optimal value is $Z = -3/5$

2) (a) Initial Dictionary of given L.P (i.e. the primal)

$$\begin{array}{ll} P \Rightarrow & x_3 = 6 + 2x_1 - 7x_2 \\ & x_4 = -1 + 3x_1 - x_2 \\ & x_5 = 6 - 9x_1 + 4x_2 \\ & x_6 = 3 - x_1 + x_2 & x_1, x_2, x_3, x_4, x_5 \\ & x_7 = 6 - 7x_1 + 3x_2 & x_6, x_7, x_8 \geq 0 \\ & x_8 = -3 + 5x_1 - 2x_2 \\ \hline & Z = -2x_1 - 2x_2 \end{array}$$

Initial Dictionary of its Dual.

$$\begin{array}{ll} D \Rightarrow & y_7 = 1 - 2y_1 - 3y_2 + 9y_3 + y_4 + 7y_5 - 5y_6 \\ & y_8 = 2 + 7y_1 + y_2 - 4y_3 - y_4 - 3y_5 + 2y_6 \\ \hline & Z = -6y_1 + y_2 - 6y_3 - 3y_4 - 6y_5 + 3y_6 \end{array}$$

$$y_1, y_2, y_3, y_4, y_5, y_6, y_7, y_8 \geq 0$$

(b) Dictionary of Primal \Rightarrow Infeasible (as coefficients are -ve)
Dictionary of Dual \Rightarrow feasible

Matrix form of Primal

$$\begin{bmatrix} 0 & -1 & -2 \\ 6 & 2 & -7 \\ -1 & 3 & -1 \\ 6 & -9 & 4 \\ 3 & -1 & 1 \\ 6 & -7 & 3 \\ -3 & 5 & -2 \end{bmatrix} \begin{bmatrix} 1 \\ x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} z \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \\ x_8 \end{bmatrix}$$

↓
(P)

Matrix form of Dual.

$$\begin{bmatrix} 0 & -6 & 1 & -6 & -3 & -6 & 3 \\ 1 & -2 & -3 & 9 & 1 & 7 & -5 \\ 2 & 7 & 1 & -4 & -1 & -3 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \end{bmatrix} = \begin{bmatrix} \xi \\ y_7 \\ y_8 \end{bmatrix}$$

↓
(D)

(c) The relation between the two matrices is,

$$P = -D^T$$

The slack variables of primal becomes the decision variables of dual & decision variables of primal becomes the slack variables of dual.

$$\begin{array}{cccccc} x_3 & x_4 & x_5 & x_6 & x_7 & x_8 \\ & & & & x_1 & x_2 \end{array} \Rightarrow y_1, y_2, y_3, y_4, y_5, y_6, y_7, y_8$$

3) (a) Initial dictionary of given L.P

$$\begin{aligned}
 D \Rightarrow \quad x_3 &= 6 + 2x_1 - 7x_2 \\
 x_4 &= -1 + 3x_1 - x_2 \\
 x_5 &= 6 - 9x_1 + 4x_2 \\
 x_6 &= 3 - x_1 + x_2 \\
 x_7 &= 6 - 7x_1 + 3x_2 \\
 x_8 &= -3 + 5x_1 - 2x_2 \\
 \underline{Z} &= \quad -x_1 - 2x_2
 \end{aligned}$$

Since D is infeasible, we must do the Initialisation phase & solve the Auxiliary problem.

So, now $Z = -x_0$, & new dictionary of the Auxiliary problem is.

$$\begin{aligned}
 D' \Rightarrow \quad x_0 &= 3 - 5x_1 + 2x_2 + x_8 \\
 x_3 &= 9 - 3x_1 - 5x_2 + x_8 \\
 x_4 &= 2 - 2x_1 + x_2 + x_8 \\
 x_5 &= 9 - 14x_1 + 6x_2 + x_8 \\
 x_6 &= 6 - 6x_1 + 3x_2 + x_8 \\
 x_7 &= 9 - 12x_1 + 5x_2 + x_8 \\
 \underline{Z} &= -3 + 5x_1 - 2x_2 - x_8
 \end{aligned}$$

' x_1 ' is entering & ' x_0 ' is leaving variable.

$$\begin{aligned}
 D'' \Rightarrow \quad x_1 &= 0.6 + 0.4x_2 + 0.2x_8 - 0.2x_0 \\
 x_3 &= 7.2 - 6.2x_2 + 0.4x_8 + 0.6x_0 \\
 x_4 &= 0.8 + 0.2x_2 + 0.6x_8 + 0.4x_0 \\
 x_5 &= 0.6 + 0.4x_2 - 1.8x_8 + 2.8x_0 \\
 x_6 &= 2.4 + 0.6x_2 - 0.2x_8 + 1.2x_0 \\
 x_7 &= 1.8 + 0.2x_2 - 1.4x_8 + 2.4x_0 \\
 \underline{\underline{Z}} &= -x_0
 \end{aligned}$$

Sub back the original problem, we get.

$$\begin{aligned}
 D^* \Rightarrow \quad x_1 &= 0.6 + 0.4x_2 + 0.2x_8 \\
 x_3 &= 7.2 - 6.2x_2 + 0.4x_8 \\
 x_4 &= 0.8 + 0.2x_2 + 0.6x_8 \\
 x_5 &= 0.6 + 0.4x_2 - 1.8x_8 \\
 x_6 &= 2.4 + 0.6x_2 - 0.2x_8 \\
 x_7 &= 1.8 + 0.2x_2 - 1.4x_8 \\
 \hline
 z &= -0.6 - 2.4x_2 - 0.2x_8
 \end{aligned}$$

Since, no entering variable, D^* is final dictionary
 Sub x_2 & $x_8 = 0$, we get.

$$\begin{aligned}
 x_1 &= 0.6; x_3 = 7.2; x_4 = 0.8; x_5 = 0.6; x_6 = 2.4; \\
 x_7 &= 1.8 \quad \& \text{ value of } z = -0.6.
 \end{aligned}$$

optimal sol. $(x_1, x_2) = (0.6, 0)$
 optimal value = -0.6 .

(b) Initial dictionary of the Dual of the above LP's

$$\begin{aligned}
 D \Rightarrow \quad y_7 &= 1 - 2y_1 - 3y_2 + 4y_3 + y_4 + 7y_5 - 5y_6 \\
 y_8 &= 2 + 7y_1 + y_2 - 4y_3 - y_4 - 3y_5 + 2y_6 \\
 \hline
 z &= -6y_1 + y_2 - 6y_3 - 3y_4 - 6y_5 + 3y_6
 \end{aligned}$$

' y_6 ' is entering & ' y_7 ' is leaving Variable

$$\begin{aligned}
 D' \Rightarrow \quad y_6 &= 0.2 - 0.4y_1 - 0.6y_2 + 1.8y_3 + 0.2y_4 + 1.4y_5 - 0.2y_7 \\
 y_8 &= 2.4 + 6.2y_1 - 0.2y_2 - 0.4y_3 - 0.6y_4 - 0.2y_5 - 0.4y_7 \\
 \hline
 z &= 0.6 - 7.2y_1 - 0.8y_2 - 0.6y_3 - 2.4y_4 - 1.8y_5 - 0.6y_7
 \end{aligned}$$

Since, no entering variable, D' is final dictionary,
Sub $y_1, y_2, y_3, y_4, y_5 \Delta y_7 = 0$, we get.

$$y_6 = 0.2; y_8 = 2.4 \text{ \& } z = 0.6$$

Since, we converted the min problem to max.
problem; the optimal sol.

$$(y_1, y_2, y_3, y_4, y_5, y_6) = (0, 0, 0, 0, 0, 0.2)$$

optimal value = $(-z) = -0.6$.

(c) Primal - dual Certificate verification.

if x^* feasible solution of primal.

y^* feasible solution of Dual

$$\text{then } CX^* = dY^*$$

From 3(a) we know $x^* = (0.6, 0)$ & $CX^* = -0.6$

111174 3(b) we know $y^* = (0, 0, 0, 0, 0, 0.2)$ & $dY^* = -0.6$

$$\Rightarrow CX^* = dY^*$$

\therefore the primal - dual Certificate is verified.
